

Internship Project — Week 1

Project Title: House Price Prediction

Write a short paragraph (5–8 lines) inside a Markdown cell in your notebook answering these four points:

1. Which features influence house price the most?

Most Influential Features: (Look at my heatmap. Which columns have the highest correlation value with price? Usually, these are area, bathrooms, and stories.)

2. How accurate was your model (in plain terms)?

Model Accuracy: (Reference the R^2 score from my Task 3 output. For example: "The model explains X% of the variation in house prices.")

3. What surprised you in the data?

The "Area vs. Bedrooms" Surprise (Most Common)"What surprised me most was that the total area of the property had a much stronger influence on the final price than the number of bedrooms. I initially assumed that the number of bedrooms would be the primary driver, but the data showed that square footage (area) and the number of bathrooms are much more significant predictors of value.

4. One recommendation for a real estate business based on your findings

Business Recommendation: (Based on my analysis, what should a real estate business focus on? E.g., "Real estate firms should prioritize listings with higher square footage and more bathrooms, as these are the primary drivers of property value.")
